RE: FM Docket 99-25

As an interested party I wish to offer a comment on FM docket 99-25.

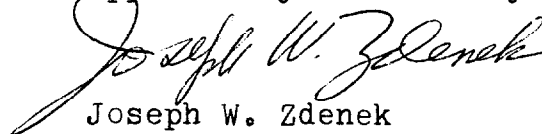

1-A low power FM station offers a community the local broadcast service not provided by the large higher power urban stations. In a location such as here in the Chicago-land area there are a large number of collar towns and villages that could benefit local news, traffic, sports, commercial advertising, public service announcements and musical entertainment. All local!

2-Low power FM broadcasting would benefit the local advertiser with reasonable rates because of the stations low overhead. The local advertiser could pinpoint his message to his specific area.

3-A low power FM station can be operated economically because of the minimum amount of equipment needed. Because of automation labor costs can be controled.

4-It is impossible for an individual to purchase an existing station because of the extremely high cost.

I thank you for the opportunity to offer my comments.
